

PowerTerm® RemoteView is a small software package which makes it possible to *publish* remote windows applications over RDP protocol. Unlike regular RDP, *PowerTerm® RemoteView* allows connecting Thin Client users directly to a remote application rather than an entire desktop. Remote applications executed in this way are frequently referred to as *seamless* applications. The term *seamless* refers to a mode of work where remote applications look and behave in exactly the same way as local applications. *Seamless* server-based applications resize and minimize on the Thin Client similar to local applications. Previously only Citrix ICA protocol made such functionality available for Thin Clients. *PowerTerm® RemoteView* offers the same functionality over RDP protocol at a fraction of ICA cost.

PowerTerm® RemoteView features:

- Low cost
- Small footprint (< 200KB)
- Support for Windows XPe, Window CE and Linux based Thin Clients
- Support for Windows 2000 and Windows 2003 Terminal Servers

Thin Client Manufacturers continually struggle to reduce costs while improving overall functionality and performance of their products. With unique *PowerTerm® RemoteView* technology they can now offer world-class Thin Client functionality at a much lower cost, thus gaining a significant advantage over their competitors.
