

Ericom Application Isolator

Give Your VPN a Zero Trust Security Boost

The simple, cost-effective way to add granular network access security controls to your VPN

Secure existing
VPNs and Firewalls
with Least Privilege
Access Control

More Secure

- Applications are “cloaked” from the internet. Hackers cannot attack what they cannot see.
- Authenticated users are granted only granular, permission-based application-level access, reducing the risk of attack by malicious insiders.
- Leverages strong authentication and encrypted communication using proven VPN technology already in place in your organization.
- Strengthens overall network security posture by extending granular application access security to internal “east-west” network traffic.

Easy for IT

- Software is simple to deploy and configure within the network, and integrates with all market-leading VPN and NGFW solutions.
- By leveraging existing VPN gateway and agents, Ericom Application Isolator enables organizations to simply “add and make better” instead of embarking on time-consuming, costly “rip and replace” projects.
- Automatically create least-privilege access policies based on network analysis of traffic patterns for each individual, and adjust easily as user needs change.

Simple for Users

- No new agent to download and manage; no change in VPN sign-in process or network login.

Least-Privilege Access Control for Remote Users
